

ABSTRACT

This invention relates to an optical device (1) including a cavity (2) for which at least part is ellipsoidal with a first focus (F_1) and a second focus (F_2), the device including means of presenting a medium
5 containing components to be analysed in the cavity at the first focus, the device also including means of transporting an excitation light beam in the cavity along a path also passing through the first focus (F_1) to illuminate the medium at the first focus. The
10 ellipsoidal part of the cavity includes a wall reflecting light emitted by the medium in response to the excitation light beam, the device including means (5) of collecting said emitted light at the second focus (F_2).
